

OhSINT

It was an Easy machine focusing on open source intelligence.

SETUP-

An windows xp wallpaper jpeg image was provided and the caption was to extract as much information from this image.

PROCESS-

1. I first went to the meta data of the image and found copyright username and geolocation.
2. Then I tried to use the coordinates given to find the location and got somewhere in Malaysia, which was proved to be useless.
3. Then I used the username and found an X(twitter) and github account.
4. The X account had a post of BSSID, which is like a MAC for wifi routers and from there I went to Wigle.net and used the BSSID and found it was somewhere and London and also found SSID.
5. Then I went to github and found his mail and his blog site
6. On his blog site he wrote he was going to New York for the vacation
7. At last we needed his mail password , I didn't find it anywhere on his X, github account but after inspecting his blog site I got the password as well.
